How I learnt and achieved a high GPA score?

Learning in university is very different from learning in secondary school. Back in secondary school, teachers give you all the notes that students should remember and learn as they will come up in the exam. However, learning in university is vastly different. Students need to be more proactive in their learning in order to get a high GPA score. Lecturers will supply you with the tools to learn. In order to achieve decent GPA scores, I usually re-organize the notes given into something I am able to read more efficiently. Although the notes by lecturers and tutors are very clear, they are mostly in powerpoint forms and there are a large amount of them. Making them more concise and highlighting the key points can help me reduce the study time, thus, able to read and understand more. Moreover, exams are only a part of the assessment. Other aspects including projects and reports are also important to the GPA score. To do well for those areas, reading the notes are not enough. I need to go to the library or the Internet to acquire additional information as projects usually require students to apply the knowledge learnt in class into the real world. All in all, learning and achieving high GPA in university require me to understand the content of the course and apply the knowledge learnt.
