

# **Capital Flight to Germany: Two Alternative Measures**

**Yin-Wong Cheung, Sven Steinkamp, Frank Westermann**

# Motivation

- Gross financial outflows (mirror image of CA)
- Germany as a European “safe heaven” => Capital Flight
- Measure 1: Intra-EA - TARGET2:
  - Clearing system records net capital flows
  - Arise from decentralized monetary policy implementation
- Measure 2: Globally - TMI:
  - Germany rather lenient on controlling illicit inflows
  - Financial Action Task Force (2010, 2014)
- Important drivers: common macro-fundamentals, economic policy uncertainty, measure specific factors

## Measure 1: Adjusted TMI

- Discrepancies in mirror trade statistics (Bhagwati, 1981, 1964; Cardoso and Dornbusch, 1989)
- $TMI = EUI + IOI$

$$IOI = \sum_i^q [MC_{i,t} - MW_{i,t} * (1 + CIF_{i,j,t})]$$

$$EUI = \sum_i^p [XW_{i,t} - XC_{i,t} * (1 + CIF_{i,j,t})],$$

- CIF Adjustment is crucial

# Measure 1: Adjusted TMI

- Commonly assumed: CIF = 10%
- But:
  - German CIF considerably lower (~ 2.3% in 2014)
  - Vary over time (Hummels, 2007; Jacks et al., 2008)
  - Asymmetric - exporting vs. importing country (Wei *et al.* 2018)
- New OECD estimates (time, product and country-pair specific)
- $$CIF_{i,j,t} = \sum_{g=1}^m \widehat{CIF}_{i,j,t,g} \frac{\nu_{t,i,g}}{\frac{1}{m} \sum_{g=1}^m \nu_{t,i,g}}$$

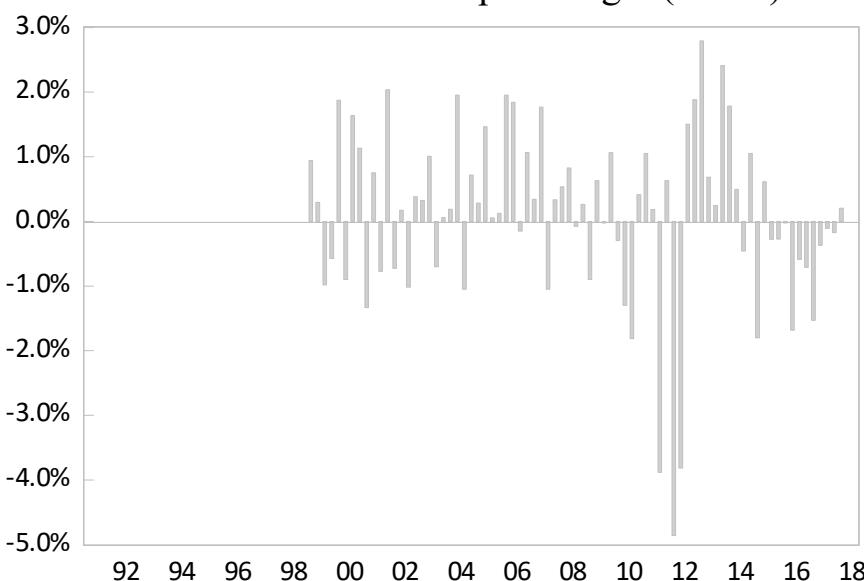

## Measure 2: Private EA Capital Flight (PEAF)

- TARGET2 balances (T2) (Garber, 2010)
- Database: [www.eurocrisismonitor.com](http://www.eurocrisismonitor.com)
- Often itself interpreted as measure of CF
- But, T2 also contains
  - 1) Capital flows by official institutions (e.g. payments into the ESM),
  - 2) Current account imbalances (Sinn and Wollershäuser (2012))
  - 3) Outright transfers (say, development assistance)
- $PEAF = -(\Delta T2) + CA^{EA} + CAP^{EA} + FA^{EA, Gov}$

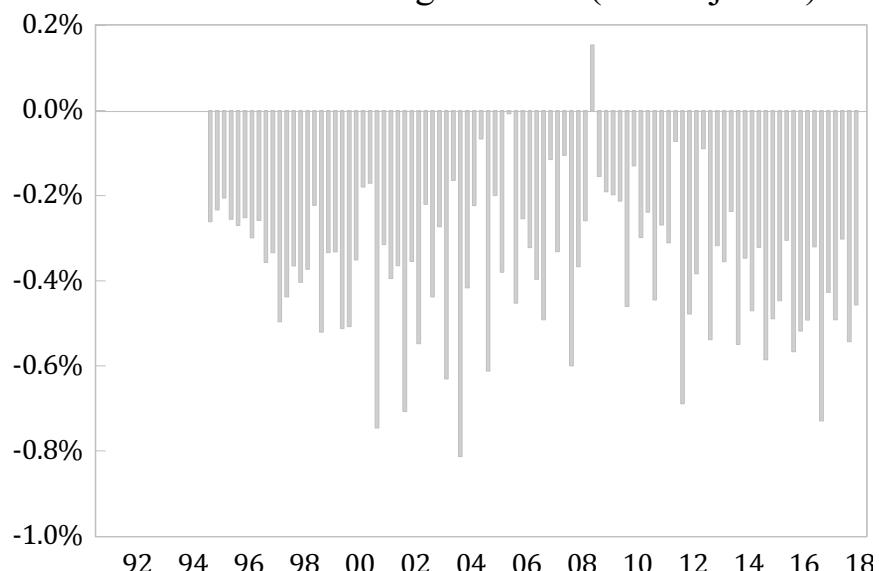

# Sample and Descriptive Statistics

- Sample period: 1995Q1 to 2018Q3
- Sum of TMI and PEAF
  - On average, 25bn Euro per year
  - Accumulated to almost 600 billion euros ~ 70% of today's GDP.
- Measures capture different phenomena
  - Correlation: 0.265

#### 1a. Private Euro Area Capital Flight (PEAF)

#### 1b. Trade Misinvoicing Measure (CIF-adjusted)

# Baseline specification

$$(1) \quad Y_{t,TMI} = \alpha + \lambda' CID_t + \theta' X_t + \delta' M_t + \beta' W_t + \varepsilon_t$$

$$(2) \quad Y_{t,PEAF} = \alpha + \lambda' CID_t + \theta' X_t + \delta' M_t + \beta' Z_t + \varepsilon_t$$

- $CID_t$ : Deviation from the covered interest parity
- $X_t$ : Economic determinants deemed common to TMI/PEAF
  - Captures motives to ...
    - ... avoid country risk (gov. debt, fiscal bal., real GDP growth),
    - ... currency debasement (inflation diff., currency misalignment),
    - ... volatile investments (stock price volatility),
    - ... minimize taxation (tax ratio)
- $M_t$  includes M1 and M3 money growth rates

## Baseline specification (cont'd)

$$(1) \quad Y_{t,TMI} = \alpha + \lambda' CID_t + \theta' X_t + \delta' M_t + \beta' W_t + \varepsilon_t$$

$$(2) \quad Y_{t,PEAF} = \alpha + \lambda' CID_t + \theta' X_t + \delta' M_t + \beta' Z_t + \varepsilon_t$$

- $W_t$ : TMI-specific determinants
  - Exchange rate volatility,
  - Import duties
  - Size of the shadow economy
  - (De facto) trade openness
- $Z_t$ : PEAF-specific determinants
  - Interest spread of EA crisis countries (“financial panick hypothesis”)
  - Proxy of redenomination risk (Google searches for “euro breakup”)
  - Flexibility in the Eurosystem’s collateral standards.

# Results 1A

# Robustness I

- Sensitivity to CIF assumption
  - Alternative source of CIF estimates: CEPII's BACI
  - Ad-hoc  $CIF_{i,j,t} = 10\% \quad \forall i, j, t$
- Measurement error: Drop trade-partners with low statistical quality
  - Lowest quartile according to the WB statistical capacity score
  - Below median according to the WB statistical capacity score

# Results 3

# Additional Analyses

- Additional factors:
  - (i) Geopolitical risk (violent conflicts; geopolitical risk index by Caldara and Iacoviello, 2018), (ii) Greek private sector involvement (PSI), (iii) Deauville meeting, where the option of a PSI was first discussed, (iv) stock market volatility in the US or Europe (captured by the VIX/VSTOXX)
- Types of (Greek) policy uncertainty
- Non-linearities: Bailout expectations after Deauville meeting
- ECB's QE (extended Asset Purchase Programme – APP)

# Summary and Policy Conclusions

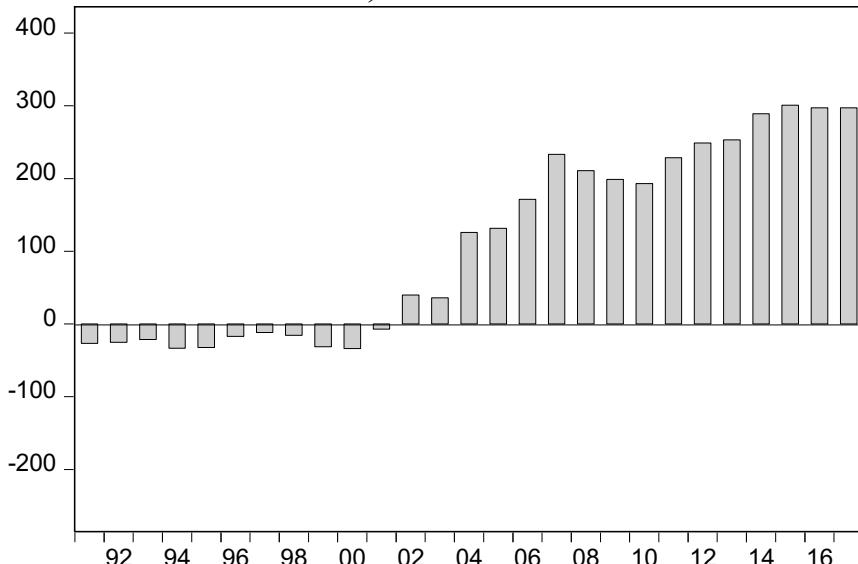

- There exist - at least - two distinctly different types (or channels) of capital flight
- We propose two refined proxies to measure them
- Sizable flight-to-safety after the GFC ( $> 2\%$  GDP)
- To curb (illicit) capital flows, it may not be sufficient to implement national regulatory reforms (as suggested by the FATF task force)
- It is important to take macroeconomic developments into account that are ultimately driving the capital flight towards Germany

# Summary and Policy Conclusions

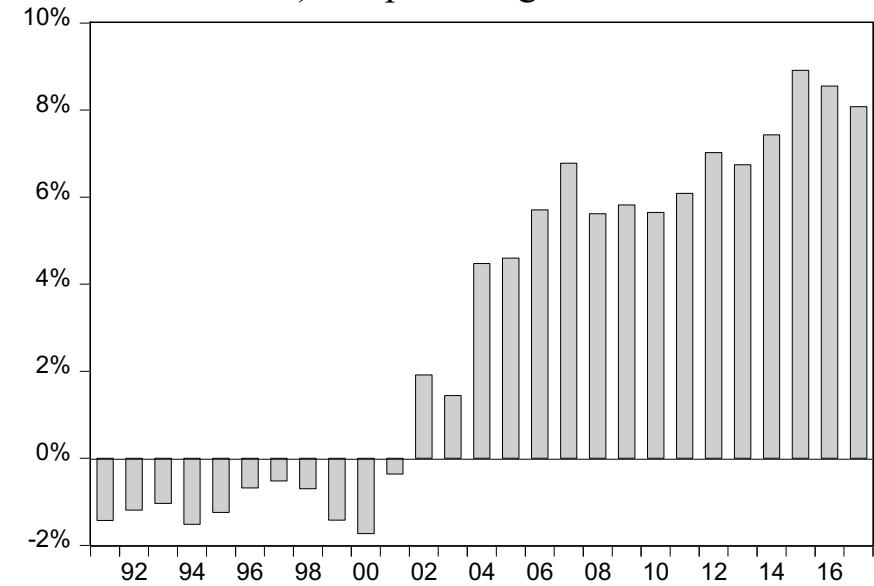

- Different types of capital flight mostly have different determinants;
- Traditional determinants (e.g. CID) play little role
- TMI mostly driven by macro-fundamentals, and /tax- and tariff circumvention
- PEAF responds to higher default risk, Euro-breakup risk, collateral standards and policy uncertainty.
- Rather than legal limits on T2, the balances can be influenced indirectly.

**Figure 1: Germany's Net Current Account Position**

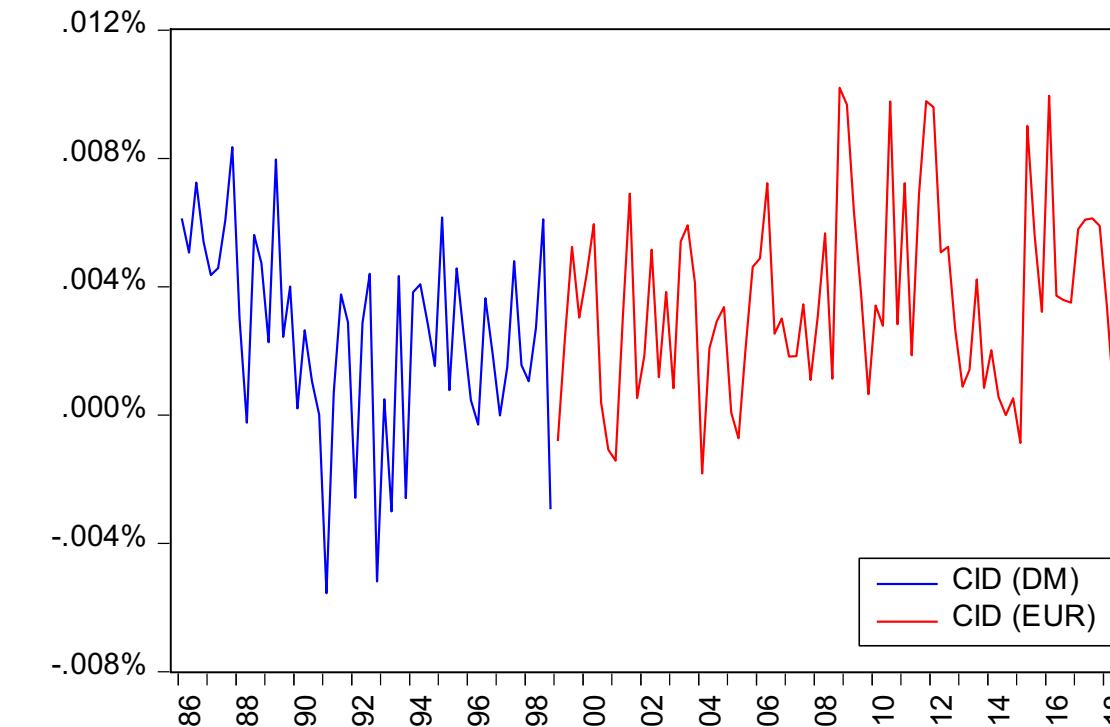

a) in bn. USD

b) as percentage of GDP

**Figure 3: Deviations from the Covered Interest Parity (CID)**

Notes: Quarterly average of Germany's daily covered interest differentials (blue: DM; red: EUR). It is given by the nominal interest rate differential ( $RDiff$ ) plus the forward premium ( $FP$ ), i.e.  $CID = RDiff + FP = (r - r^*)/(1 + r^*) + (F - S)/S$ , where  $r$  is the London interbank offer rate (DM-based until 1998; then EUR-based),  $r^*$  is the US\$ LIBOR,  $F$  is the forward rate and  $S$  is the spot exchange rate (DM/USD until 1998; then EUR/USD).  $r$ ,  $r^*$  and  $F$  are annualized three-month rates in daily frequency.
